

# Design of an electricity consumption measurement system for Non Intrusive Load Monitoring

S. Houdi, F. Auger, P. Frétaud, D. Fourer, L. Miègeville, H. Ben Attia

The 10<sup>th</sup> International Renewable Energy Congress, March, 26-28, 2019  
Sousse, Tunisia

# Outline

- 1 Introduction
  - Context and problematic
  - Non Intrusive Load Monitoring
- 2 State of the art of the industrial marketed products for electricity consumption measurement
  - Characteristics of the industrial marketed products
  - Prototype requirements
- 3 Architecture of the acquisition system
  - Acquisition system overview
  - Current conditioning stage
  - Voltage conditioning stage
  - Data sampling and storage
- 4 Experimental results
- 5 Conclusion and perspectives
  - Conclusion
  - Perspectives

## 1 Introduction

- Context and problematic
- Non Intrusive Load Monitoring

## 2 State of the art of the industrial marketed products for electricity consumption measurement

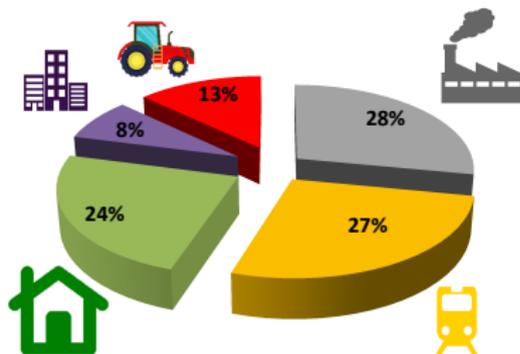

## 3 Architecture of the acquisition system

## 4 Experimental results

## 5 Conclusion and perspectives

# Global context

- Contribution of the residential sector to 24% of the electricity consumption in the world.
- Population growth
- Growing number of Home Electrical Appliances (HEAs) and wide diversity

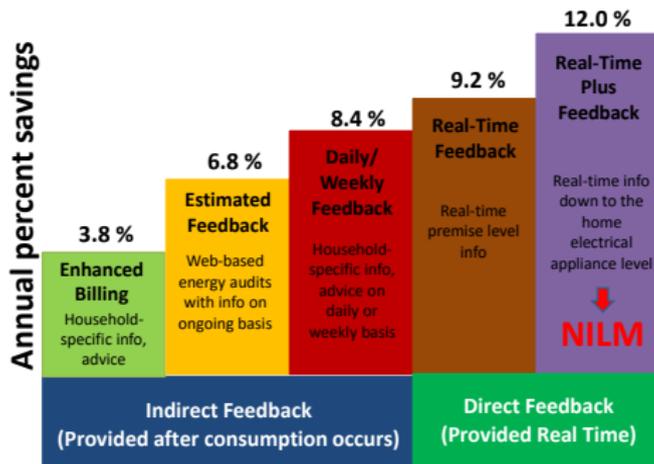

**Source:** International Energy Agency, Energy balance of the world, accessed July 2011.

⇒ Consequences on electricity bills and environment

# Solution

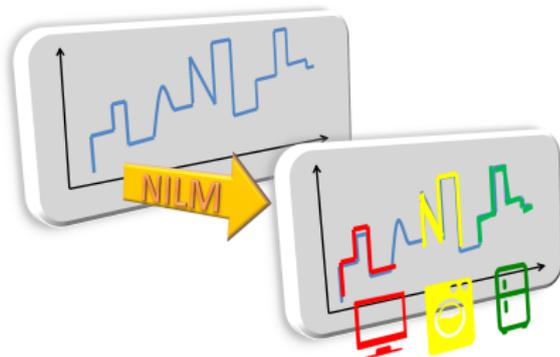

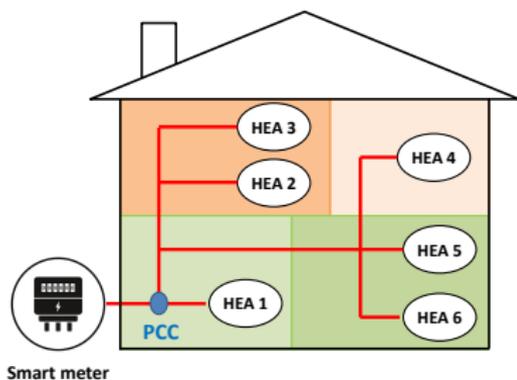

- Real-time information down to the HEA level relayed back to the consumers

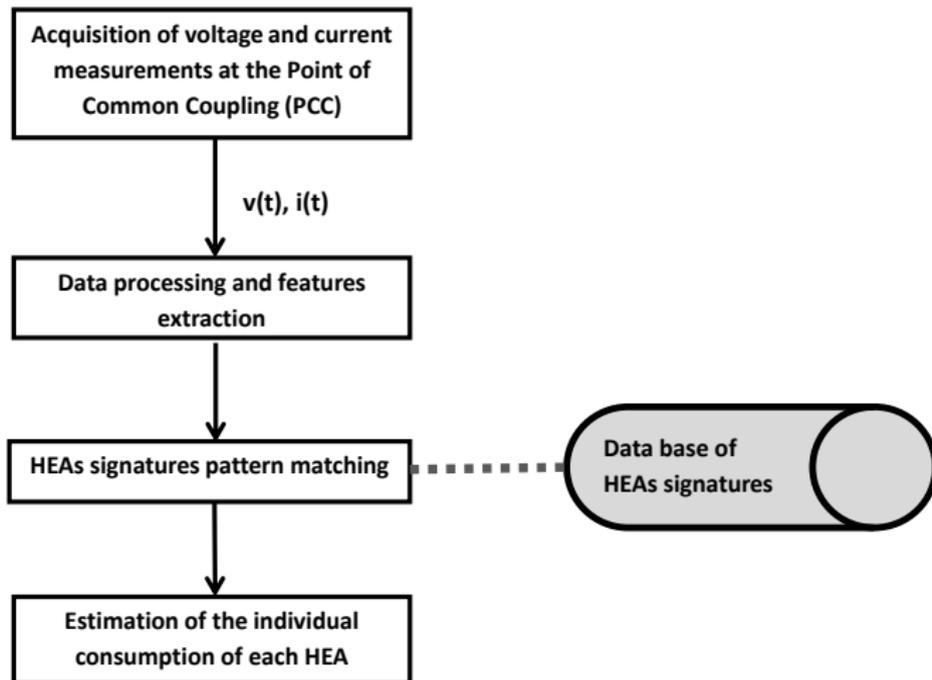

**Source:** American Council for an Energy Efficient Economy (ACEEE) 2010

# NILM goals

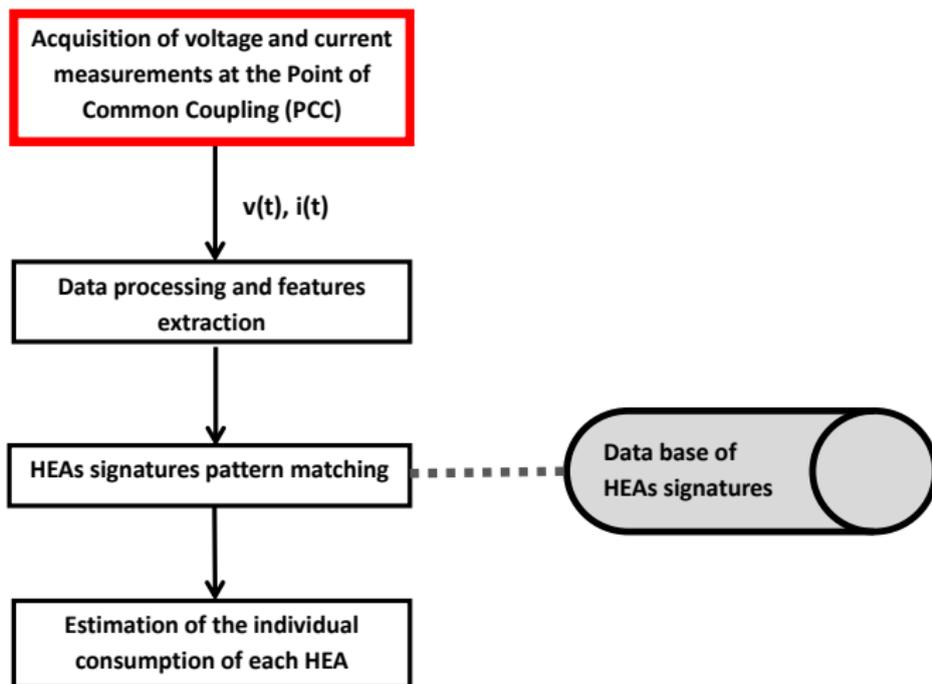

- Estimation of the individual consumption of each HEA from the load curve disaggregation by acquiring voltage and current measurements at the Point of Common Coupling (PCC).

# Supervised NILM methods

# Supervised NILM methods

## Problematic

**Design and development of a low cost and and easy to install metering unit for real-time current and voltage acquisition of individual HEA and whole houses**

## 1 Introduction

## 2 State of the art of the industrial marketed products for electricity consumption measurement

- Characteristics of the industrial marketed products
- Prototype requirements

## 3 Architecture of the acquisition system

## 4 Experimental results

## 5 Conclusion and perspectives

# Industrial marketed products

**TED 5000**

**Neurio**

**Sense Home Energy**

**Eyedro**

\*: Professional installation is required

## Criteria of the proposed measurement system

- ⇒ A low power device, cheap to produce and to deploy
- ⇒ A sampling rate that allows to extract harmonics up to the 15<sup>th</sup> range (higher than 1.5 kHz according to Shannon theorem) and that supports long-time measurements
- ⇒ A good resolution
- ⇒ A low cost
- ⇒ An autonomous device with a dedicated power supply
- ⇒ An easy installation
- ⇒ A measurement capability of  $\approx 6kW$  corresponding to a conventional house power contract

## 1 Introduction

## 2 State of the art of the industrial marketed products for electricity consumption measurement

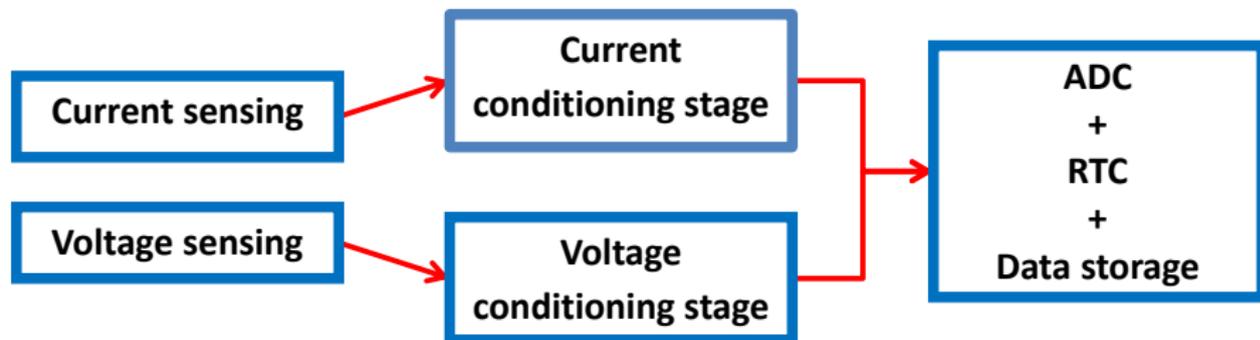

## 3 Architecture of the acquisition system

- Acquisition system overview
- Current conditioning stage
- Voltage conditioning stage
- Data sampling and storage

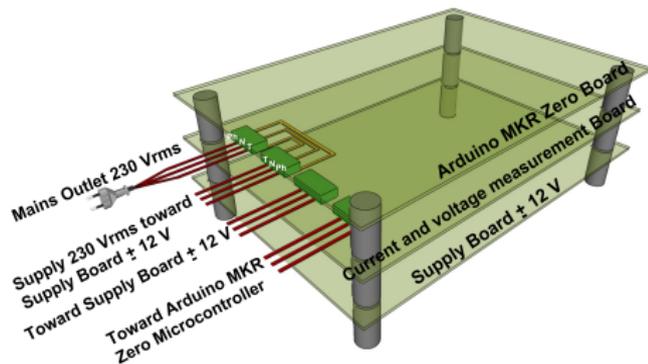

## 4 Experimental results

## 5 Conclusion and perspectives

# Data acquisition

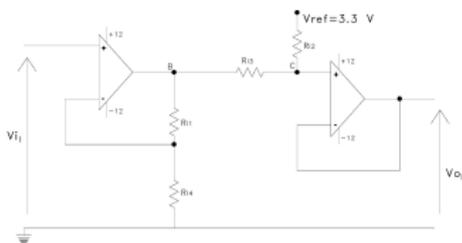

# Designed prototype

- Plugging of the system into a wall outlet
- $2 \times 12\text{V-5VA}$  transformer whose output is given to a bridge rectifier that converts the AC to DC, and delivers the voltage to a filter circuit
- 2 voltage regulators IC 7812 et IC 7912 to obtain an output voltage of  $\pm 12\text{ V}$
- Arduino MKR Zero microcontroller supplied with 5 V via an IC 7805 voltage regulator
- ADC microcontroller voltage range: **0-3.3 V**

# Current conditioning circuit

- $V_{iI}$  = s.i: voltage delivered by the ammeter
- $i$ : load current measured in one of the domestic network phases
- $s=10$  mV/A: current probe sensitivity
- Non-inverting OP27 opamp circuit ( $R_{I4}$ ,  $R_{I1}=8.25$  k $\Omega$ )  
 $\Rightarrow V_B = \left(1 + \frac{R_{I4}}{R_{I1}}\right) V_{iI}$

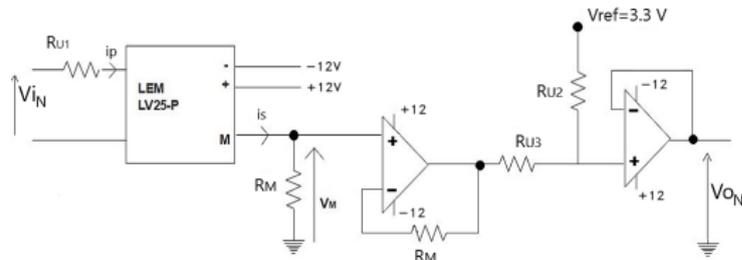

- Resistive voltage divider and opamp voltage follower circuit
- $R_{I2}=R_{I3}=1$  k $\Omega$  so that  $V_{oI} = \frac{V_{ref}}{2}$  when  $i = 0$  A
- When input current  $i_+$  is negligible:

$$\frac{V_B - V_{oI}}{R_{I3}} + \frac{V_{ref} - V_{oI}}{R_{I2}} \approx 0A$$

$$V_{oI} = \frac{R_{I3}}{R_{I2} + R_{I3}} V_{ref} + \frac{R_{I2}}{R_{I2} + R_{I3}} \left(1 + \frac{R_{I1}}{R_{I4}}\right) s i$$

- When  $V_{oI} = 3.3$  V,  $i_{max}=35.67$  A peak value  
 $\Rightarrow P_{max} = 230 i_{max}/\sqrt{2} \approx 5802$  W
- Current granularity:  $q_I = \frac{q_V}{s} \frac{1+R_{I3}/R_{I2}}{1+R_{I1}/R_{I4}} \approx 69$  mA  
 $\Rightarrow$  Active power granularity:  $q_P = \frac{q_I}{\sqrt{2}} 230 \approx 11.3$  W

# Voltage conditioning circuit

- LEM LV 25-P voltage sensor with a conversion ratio of 2.5
- Input voltage max:  $V_{iNmax} = 230\sqrt{2}$  V,  
Maximum primary current  $i_{p\ max} = 10$  mA  
 $\Rightarrow R_{U1} = \frac{V_{ue\ max}}{i_{p\ max}} \approx 32.5$  k $\Omega$   
 $\approx 3$  resistors in parallel of 100 k $\Omega$
- $V_M = 2.5 \frac{R_M}{R_{U1}} V_{iN}$

- A resistive voltage divider and 2 opamp voltage follower circuits

- $R_{U2} = R_{U3} = 1$  k $\Omega$  so that  
 $V_{oN} = \frac{V_{ref}}{2}$  when  $V_{iN} = 0$  V

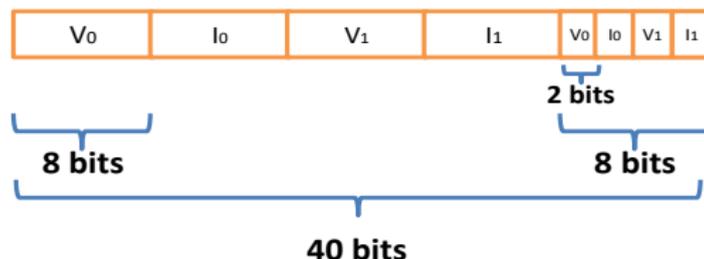

- Voltage output:  

$$V_{us} = \frac{R_{U3}}{R_{U3} + R_{U2}} V_{ref} + \frac{2.5 R_{U2} R_M}{R_M (R_{U3} + R_{U2})} V_{iN}$$

- With  $R_M = 130$   $\Omega$ ,  $V_{us} = 3.11$  V

# ADC, data sampling and storage

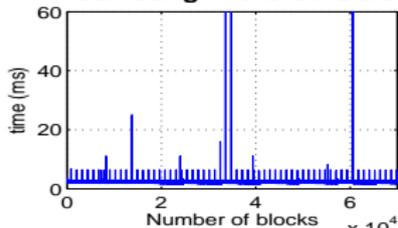

- Use of an Arduino MKR Zero microcontroller (32 bit processor SAMD21 Cortex-M0 microcontroller, 48 MHz) including ADC channels with 8/10/12 bit resolution + RTC module + micro SD card shield
- Use of two libraries to decrease the writing time into the SD card:
  - ▶ “FastADC.h” for ADC management (compatible with a 10-bit resolution)
  - ▶ “SAMDtmer.h” for timer-triggered interrupts
  - ▶ “Sd2Fat.h” for writing into the SD card
- Sampling frequency  $F_s=6.25$  kHz
- Acquisition of voltage and current when the interrupt service is triggered by the 16-bit timer
- Use of 5 bytes to store 2 successive voltage samples ( $U_0$  et  $U_1$ ) and 2 successive current samples ( $I_0$  et  $I_1$ )
- The SD card is used as an EEPROM composed of 512-byte blocks
- Writing into the SD card using the function `cardwriteBlock()`

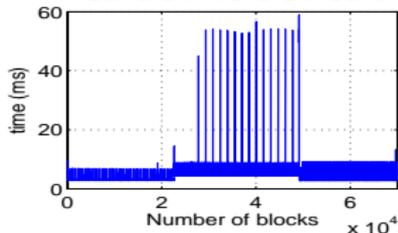

# SD card choice

- Comparison of several SD card performances in terms of required time for successively writing 510 bytes into the SD card using the function `cardwriteblock()`

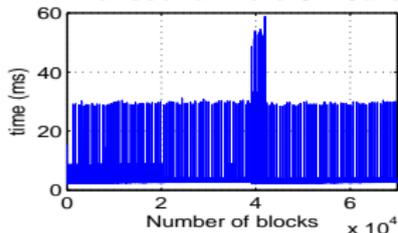

**Samsung micro SD Card**

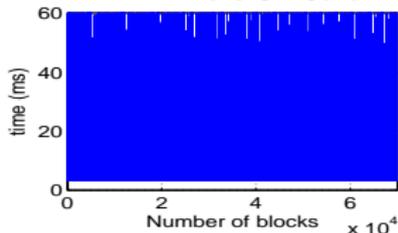

**Sandisk micro SD Card**

**Transcend micro SD Card**

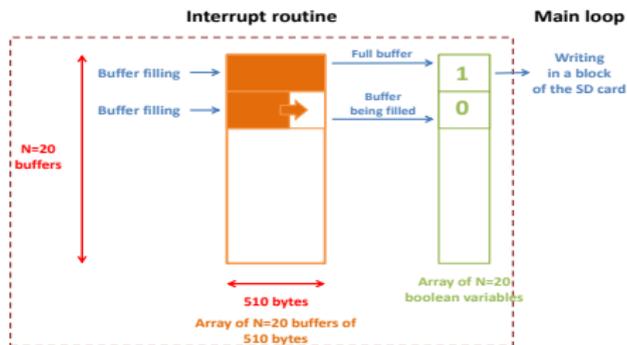

**PNY micro SD Card**

- ⇒ The 32 Go UHSI speed class Samsung EVO Plus SD card has the best performances. Writing speed of 20 MB/s and lifetime of 10 000 writing cycles.

# CAN, échantillonnage et stockage des données

- Use of an array  $A_{Buffer}$  of  $N=20$  buffers of 510 bytes
- One buffer can store  $510 \times 2/5 = 204$  voltage samples and 204 current samples
- Buffers are filled one by one
- Use of an array  $A_{Bool}$  of  $N=20$  boolean variables
- A boolean variable is set to 1 when a buffer is full, otherwise 0
- Signalization to the program main loop that the full buffer must be stored in the SD card
  - ▶ Required time to fill a buffer:  $204/6250 \approx 32.6$  ms
  - ▶ Average writing time in a block of the SD card  $\approx 4$  ms  $\Rightarrow F_{S_{max}} = \frac{204}{4 \cdot 10^{-3}} = 51$  kHz

# ADC, data sampling and storage

- Data acquisition during:  $\frac{204 \times 32.2^{30}}{6250 \times 512} \text{ s} \approx 25.4 \text{ days}$   
(50 days using a 64 Go SD card)
- Use of the first block of the SD card to specify: the total number of acquisitions, the number of the first completed block, the date and time
- Use of two push buttons:
  - ▶ Start/stop an acquisition
  - ▶ Start/stop the transmission of the recorded data on the SD card to a PC via the USB connection cable
- Possibility to select the line or lines the user wants to transmit

- 1 Introduction
- 2 State of the art of the industrial marketed products for electricity consumption measurement
- 3 Architecture of the acquisition system
- 4 Experimental results**
- 5 Conclusion and prospectives

## Acquisitions made

- Measure of individual HEAs' current and voltage
- Measure of a complete dwelling current and voltage
- Power consumption profile set up

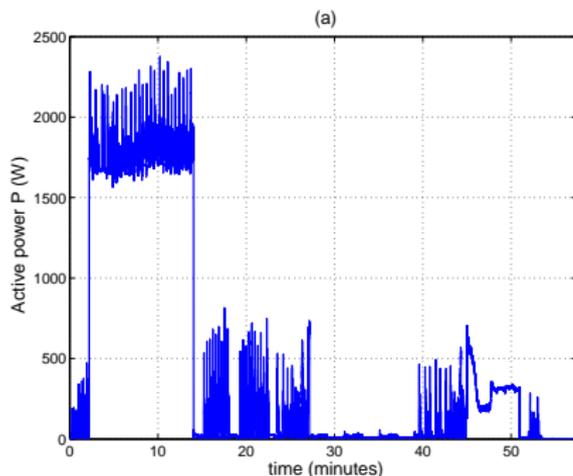

$$P[n] = \frac{1}{M} \sum_{k=n-M+1}^n v[k]i[k]$$

$M = F_e/F = \frac{6250}{50} = 125$ : number of samples per period,  
 $F = 50$  Hz: utility frequency

# Measure of individual HEAs' current and voltage 1/2

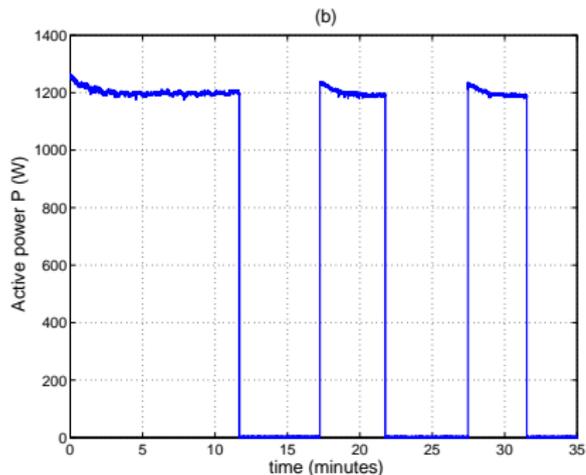

## ■ Washing machine power consumption profile

- ▶ 30 °C, "Rapid" mode, spin of 800 cycles per minute
- ▶ water heating, rinse and spinning.

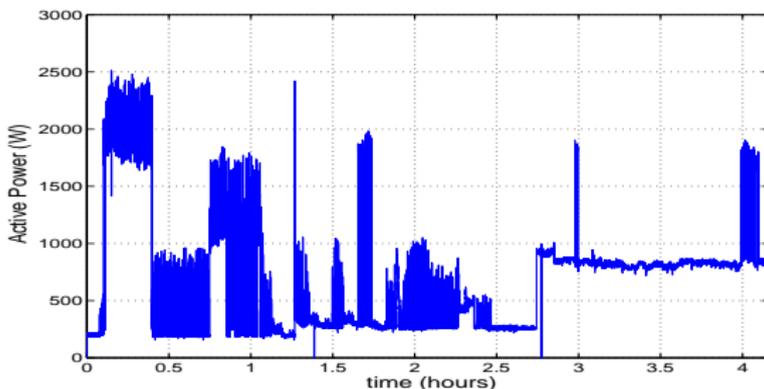

## Measure of individual HEAs 'current and voltage 2/2

- Power consumption profile of an electric oven
  - ▶ 250 °C , on/off control
  - ▶ Heating phase

## Measure of a house current and voltage

- 24h power consumption profile of a complete dwelling (4h extract):  
operation of a washing machine during 2h 30,  
activation of a LCD TV followed by an electrical oven
- constant power consumption of almost 250 W (baseload):  
two continuously operating wifi boxes  
standby power consumption of five cell phone chargers plugged in

- 1 Introduction
- 2 State of the art of the industrial marketed products for electricity consumption measurement
- 3 Architecture of the acquisition system
- 4 Experimental results
- 5 Conclusion and prospectives**
  - Conclusion
  - Prospectives

# Conclusion

- Design of a house electricity consumption measurement system
- Low cost acquisition system with:
  - a dedicated **power supply**
  - an **easy installation**,
  - a sampling frequency of **6.25 kHz**,
  - a storage capacity that allows **data acquisition during 25 days**.
- Use of an **Arduino MKR Zero** microcontroller (integrating a RTC and a micro SD card shield) in plus of **voltage and current sensing and conditioning stages**
- **Lossless compression system** for more storage into the SD card

# Prospectives

- WLAN communication with a server
- Sampling frequency increase  
(**Dilemma:**  $\nearrow F_s$ :  $\searrow$  duration of acquisition)
- Resolution increase
- Packaging improvement
- Evaluation of the compression system  
(compression rate/computational complexity)
- Real-time energy management
